

Lower Your Carbon Footprint with QC Software's Dynamic Shipping Application

QC Software is a nationally recognized leader in warehouse control software. For 15 years they have utilized innovative technologies to develop agile software designed to optimize order fulfillment and shipping operations. QC Software's results-driven solutions are leading the way in profitability, efficiency, and customer satisfaction.

Jerry List, Vice President of QC Software, states, "Our dynamic shipping application can be seamlessly integrated into the customer's system to streamline their shipping process. We provide configurable solutions so our customers can be more responsive to changing consumer demands, evolving business requirements and market fluctuations. This agility helps warehousing and distribution facilities improve performance, reduce waste, and lower their carbon footprint."

Key ways you will enhance your green initiatives with QC Software's Shipment Management System:

Reduce the volume of printed documentation – Since shipping data is contained in one application, you no longer need to enter the information several times in different systems, which is prone to mistakes. This means your printed documents are more accurate, eliminating the need to print the same document multiple times. Electronic order processing reduces the need for hard copies and expedites payment processing. Reports can be generated, store and viewed electronically.

Optimize your resources – There is a check and balance system that ensures order accuracy, thereby minimizing returns, lowering labor costs and reducing the amount of shipping material used. With shipment optimization, you reduce the number of trucks on the road, which lowers greenhouse gases and fuel costs.

Reduce expedited orders - By accurately tracking shipments, you improve on-time deliveries and minimize the need to expedite orders, which is time consuming and expensive. With a more reliable delivery system, you can reduce inventory levels and be more responsive to the customer.

Performance Improvement – QC Software's application allows you to easily measure and compare key indicators for monitoring goals and improvement planning.

WAREHOUSE CONTROL SYSTEMS

Regulations and increased social awareness are pushing companies to develop green initiatives. And, with the rapid rise in energy prices, it is more important than ever to continually improve your business model. "Our software provides greater visibility and control over the customer's operation, which means they are better prepared to meet new challenges. When you can improve customer service, lower the cost of doing business, and minimize your carbon footprint at the same time, that's a win-win situation for the company, the consumer and the environment," states Jerry List. "Our customers have been extremely satisfied with the results."
